Retrieved albedo correlated with scattering angle => BRDF effects?

OCO-2 Measurement Geometry

BRDF Formulation

$$BRDF(\theta) = [w + s(\theta - \theta_0)] F(r_0, \theta, k)$$

- w : overall BRDF amplitude [BRDF weight]
- s : slope of BRDF amplitude [BRDF weight slope]
- λ : wavelength
- λ_0 : reference wavelength (where parameters are retrieved)
- F : function describing BRDF shape (RPV kernel)
- ρ_0 : hot spot parameter = 0.05
- θ : asymmetry parameter = -0.1
- k : anisotropy parameter = 0.75
- BRDF kernel reduces to Lambertian kernel for certain choice of BRDF shape parameters
- w, s retrieved

RPV Kernel Shape

BRDF Outputs

- **w and s converted to more physically meaningful quantities, ρ_w (reflectance) and ρ_s (reflectance slope)**
- **ρ_w and ρ_s calculated by evaluating the BRDF kernel model at the primary observation geometry**
- **Reflectance factor equals ratio between reflected radiance and that from pure Lambertian surface at the same geometry**
- **For no scattering scenario, this is equivalent to a Lambertian albedo**
- **Consistency between Lambertian albedo used in v7 and effective albedo used in v8**

Conclusions

- **To-do items from last year implemented**
 - ✓ **Re-baseline with new spectroscopic models**
 - ✓ **How do we compare Lambertian and BRDF results**
 - ✓ **Implement BRDF model in operational code**
- **Increased convergence**
- **Improved AOD retrievals**
- **Reduced scatter in XCO₂ retrievals**
- **Consistency in albedo values between B7 and B8**
- **Strong correlation of albedo with scattering angle**
- **Little correlation between BRDF weight and scattering angle**

Backup Slides

OCO-2 Science Viewing Modes

Nadir Observations:

- + Small footprint ($< 3 \text{ km}^2$)
- Low Signal/Noise over dark surfaces (ocean, ice)

Glint Observations:

- + Improves Signal/Noise over oceans
- More cloud interference

Target Observations:

- Validation over ground based FTS sites, field campaigns, other targets
